

TRANSMISSION & DISTRIBUTION WORLD

Web Seminars

Squeezing more out of your transmission lines

Load pockets, constrained lines, sag limitations: These are the realities that today's utilities must face. But do we really know how much power our lines can carry and have we thoroughly investigated steps available to increase that capacity?

After decades of investment and utility demonstrations, we have confidence that innovative conductors are available to extract more value from existing right of way. State-of-the-art line monitoring systems provide us with real-time sag, tension and temperature data enabling us to coax more power out of constrained circuits.

Transmission & Distribution World magazine is offering a series of web seminars to explore these options in detail. As we line up appropriate sponsors and participants, we will roll out the web seminars to provide the latest information on low-sag and high-capacity conductors as well as providing updates on utilities using dynamic line capacity monitors and software to transport more power through existing systems.

With our sponsors, we look forward to sharing with our *T&D World* audience the tools and technologies now available to engineering, planning and operations to better to extract maximum value from our grid.
